**PRIORITY  
DOCUMENT**

SUBMITTED OR TRANSMITTED IN  
COMPLIANCE WITH RULE 17.1(a) OR (b)

**10/069202**

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

## Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

## Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

## COMPOUNDS

This invention relates to cyclopropylindoles (CPI) (which term is used to encompass cyclopropylbenzindoles (CBI)) compounds and their precursors, to methods of synthesizing these compounds on solid supports, and to compounds of utility therein. This invention further relates to collections of these compounds, and methods for identifying and isolating CPI and precursor compounds with useful and diverse activities from such collections.

10

Background to the invention

A large number of both synthetic and naturally occurring low molecular weight ligands are known that interact with DNA via a number of different mechanisms, including covalent or non-covalent interaction in the minor or major grooves, intercalation between base pairs or other types of non-specific interactions.

Of the class of ligands which interact with the minor groove, GC specific ligands include Chromomycin, pyrrolo[2,1-c][1,4]benzodiazepines (PBDs), Mitomycins and Ecteinasidins. Of these, all but Chromomycin form a covalent bond with the DNA. Of AT specific ligands, cyclopropylindoles form covalent bonds, whilst compounds such as distamycin and netropsin do not.

Cyclopropylindole (CPI) compounds are a class of highly potent antitumour antibiotics which includes the natural products CC-1065 (V.L. Reynolds et al, J. Antibiot., 39, 1986, 319-314) and the duocarmycins (D.L. Boger, Pure & Appl. Chem., 66, 1994, 837-844), having  $IC_{50}$ s in the low pM range. They are of the general structures A and B:

Studies with compounds that model the binding subunit have shown that the more stable open chain seco-precursors (e.g. A) are as potent as the cyclopropylindole compounds (e.g. B). Further, ring closure is not essential for DNA binding.

5

---

A number of synthetic analogues of the natural products have been prepared in which the oxygen of A is protected as a carbamate that must be cleaved (by non-specific enzymatic hydrolysis) for activity.

Further analogues of a similar type are disclosed in WO88/04659 and  
10 WO91/16324. Analogues where the 6 substituent is N or S are disclosed in WO 97/07097 and WO 98/11101.

Compounds having biological activity can be identified by screening collections of compounds (i.e. libraries of compounds) produced  
15 through synthetic chemical techniques. Such screening methods include methods wherein the library comprises a plurality of compounds synthesized at specific locations on the surface of a solid support where a receptor is appropriately labelled to identify binding to the compound, e.g., fluorescent or radioactive labels.  
20 Correlation of the labelled receptor bound to the support with its location on the support identifies the binding compound (US 5,143,854).

Central to these methods is the screening of a multiplicity of  
25 compounds in the library and the ability to identify the structures of the compounds which have a requisite biological activity. In order to facilitate synthesis and identification, the compounds in the library are typically formed on solid supports. Usually each such compound is covalently attached to the support via a cleavable  
30 or non-cleavable linking arm. The libraries of compounds can be screened either on the solid support or as cleaved products to identify compounds having good biological activity.

#### Disclosure of the Invention

35

The present invention provides CPI compounds with structures that allow them to be joined to combinatorial chains, as well as combinatorial libraries containing CPIs themselves.

A first aspect of the present invention relates to compounds of formula I:

wherein X is an electrophilic leaving group;

Y is selected from NH-Prot, O-Prot, S-Prot, NO<sub>2</sub>, NHOH, N<sub>3</sub>, NHR, NRR,  
5 N=NR, N(O)RR, NHSO<sub>2</sub>R, N=NPhR, SR or SSR, where Prot represents a protecting group;

A and B collectively represent a fused benzene or pyrrole ring (in either orientation), which is optionally substituted by up to respectively 4 or 2 groups independently selected from R, OH, OR,  
10 halo, nitro, amino, Me<sub>3</sub>Sn, CO<sub>2</sub>H, CO<sub>2</sub>R;

R<sub>1</sub> is a nitrogen protecting group, where if Y includes a protecting group, these protecting groups are orthogonal;

R<sub>2</sub> and R<sub>7</sub> are independently selected from H, R, OH, OR, halo, nitro, amino, Me<sub>3</sub>Sn;

15 wherein R is selected from

(a) a lower alkyl group having 1 to 10 carbon atoms,

(b) an aralkyl group (i.e. an alkyl group with one or more aryl substituents), preferably of up to 12 carbon atoms;

the alkyl group of (a) or (b) optionally containing one or more  
20 carbon-carbon double or triple bonds, which may form part of a conjugated system; and

(c) an aryl group, preferably of up to 12 carbon atoms; and

wherein R is optionally substituted by one or more halo, hydroxy, amino, or nitro groups, and optionally contains one or more hetero  
25 atoms, which may form part of, or be, a functional group;

except that when R<sub>1</sub> is Boc, Y is NO<sub>2</sub>, X is Cl, and R<sub>2</sub> and R<sub>7</sub> are H, then A and B do not collectively represent either an unsubstituted benzene ring or:

If R is an aryl group, and contains a hetero atom, then R is a heterocyclic group. If R is an alkyl chain, and contains a hetero atom, the hetero atom may be located anywhere in the alkyl chain, e.g.  $-O-C_2H_5$ ,  $-CH_2-S-CH_3$ , or may form part of, or be, a functional group, e.g. carbonyl, hydroxy.

R is preferably independently selected from a lower alkyl group having 1 to 10 carbon atoms, or an aralkyl group, preferably of up to 12 carbon atoms, or an aryl group, preferably of up to 12 carbon atoms, optionally substituted by one or more halo, hydroxy, amino, or nitro groups. It is more preferred that R is independently selected from lower alkyl groups having 1 to 10 carbon atoms optionally substituted by one or more halo, hydroxy, amino, or nitro groups. It is particularly preferred that R is an unsubstituted straight or branched chain alkyl group, having 1 to 10, preferably 1 to 6, and more preferably 1 to 4, carbon atoms, e.g. methyl, ethyl, propyl, butyl.

These compounds are useful in the synthesis of collections of CBI and CPI precursors. Compounds of formula I (including those in the proviso) can be attached to a solid support, e.g. via a connecting link which may comprise a chain of combinatorial units. This is a further aspect of the invention, i.e. the use of compounds of formula I in methods of combinatorial chemistry synthesis, wherein the compound of formula I is joined to a solid support by a chain comprising at least one combinatorial unit.

The term 'protecting group' (and more specifically 'nitrogen protecting group') has the meaning usual in synthetic chemistry, particularly for 'nitrogen protecting group', in synthetic peptide chemistry. It means any group which may be covalently bound to the protected atom of the CBI or CPI grouping, and permits reactions to be carried out upon the molecule containing this grouping without

its removal. Nevertheless, it is able to be removed from the protected atom without affecting the remainder of the molecule. Suitable protecting groups for the present invention include Fmoc (9-fluorenylmethoxycarbonyl), Nvoc (6-nitroveratryloxycarbonyl),

~~5 Teoc (2-trimethylsilylethyloxycarbonyl), Troc~~  
(2,2,2-trichloroethyloxycarbonyl), Boc (t-butyloxycarbonyl), CBZ (benzyloxycarbonyl), Alloc (allyloxycarbonyl), Psec (2(-phenylsulphonyl)ethyloxycarbonyl), (t-butyl ether), Benzyl ether, Silyl ether, MOM (methoxy methyl ether), MEM (2-methoxy  
10 ethoxy methyl ether) or acetate. Other suitable groups are described in Protective Groups in Organic Synthesis, T Green and P Wuts, published by Wiley, 1991, which is incorporated herein by reference.

15 It is preferred that the nitrogen protecting group has a carbamate functionality where it binds to the nitrogen atom to be protected.

The term 'orthogonal' in relation to 'protecting groups' has the meaning usual in synthetic chemistry. It means that one protecting  
20 group may be selectively removed without affecting the other protecting group. This is achieved by using protecting groups which are sensitive to different removal conditions.

Y is preferably NH-Prot, O-Prot, S-Prot, and more preferably NH-  
25 Prot.

It is preferred that X is either halogen or OSO<sub>2</sub>R, where R is as defined earlier. A halogen group means a fluoro, chloro, bromo or iodo group. It is more preferred that X is Cl.

30

It is further preferred that the 4,5 fused ring is substituted by -CO<sub>2</sub>R in the 2 or 3 position if it is a the benzene ring, and the 2 position if it is a pyrrole ring, e.g.

where  $R_2$  and  $R_7$  are preferably H, with the proviso that Y is not  $\text{NO}_2$ , when  $R_1$  is Boc,  $R_2$  and  $R_7$  are H, and X is Cl.

A second aspect of the present invention relates to compounds of the 5 formula **III**:

wherein X, Y, A, B,  $R_2$  and  $R_7$  are as defined in the first aspect;

T is a combinatorial unit;

and n is a positive integer, where if n is greater than 1, each T may be different;

10 L is a linking group, or less preferably a single bond;

and O is a solid support.

A third aspect of the present invention relates to compounds of formula **III'**:

where A, B, R<sub>2</sub>, R<sub>7</sub>, T, n, L and O are as defined in the second aspect; and

Y' is NH, O or S.

~~5 Compounds of this aspect are obtainable from compounds of the second~~  
 aspect by removal of the protecting group preferably carbamate in Y  
 (if present), or by other appropriate reactions, e.g. reduction  
 and/or basic conditions. The cyclisation may also occur  
 spontaneously. A fourth aspect of the present invention relates to  
 10 compounds of formula II :

wherein X, Y, A, B, R<sub>2</sub>, R<sub>7</sub>, T and n are as defined in the second aspect of the invention.

15 Compounds of this aspect are obtainable by cleavage of the linking group of the appropriate compound of the second aspect.

A fifth aspect of the present invention relates to compounds of the formula II' :

20 wherein A, B, T, n, R<sub>2</sub> and R<sub>7</sub> are as defined in the fourth aspect of the invention; and  
 Y' is NH, NR, O, or S.

Compounds of this aspect are obtainable by cleavage of the linking group of the appropriate compound of the third aspect (see below). Alternatively, they are obtainable from compounds of the fourth aspect by removal of the protecting group in Y (if present), or by other appropriate reactions, e.g. reduction and/or basic conditions. The cyclisation may also occur spontaneously.

A sixth aspect of the present invention relates to compounds of formula V:

10

where A, B, Y, R<sub>1</sub>, R<sub>2</sub>, R<sub>7</sub>, and X are defined in the first aspect of the invention (including the excluded compounds) T, n, L and O are as defined in the second aspect of the present invention.

15 A seventh aspect of the present invention relates to compounds of formula V':

where A, B, R<sub>1</sub>, R<sub>2</sub>, R<sub>7</sub>, T, n, L and O are as defined in the sixth aspect; and

20 Y' is NH, NR, O or S.

Compounds of this aspect are obtainable from compounds of the sixth

aspect by removal of the protecting group in Y (if present), or by other appropriate reactions, e.g. reduction and/or basic conditions. The cyclisation may also occur spontaneously.

~~5 An eighth aspect of the present invention relates to compounds of~~  
formula IV:

wherein A, B, X, Y, T, n, R<sub>1</sub>, R<sub>2</sub> and R<sub>7</sub> are as defined in the sixth aspect of the invention.

10 Compounds of this aspect are obtainable by cleavage of the linking group of the appropriate compound of the sixth aspect.

A ninth aspect of the present invention relates to compounds of formula IV':

15

wherein A, B, T, n, R<sub>1</sub>, R<sub>2</sub> and R<sub>7</sub> are as defined in the eighth aspect of the invention; and  
Y' is NH, NR, O, or S.

20 Compounds of this aspect are obtainable by cleavage of the linking group of the appropriate compound of the seventh aspect (see below). Alternatively, they are obtainable from compounds of the eighth aspect by removal of the protecting group in Y (if present), or by other appropriate reactions, e.g. by redcution and/or basic

conditions. The cyclisation may also occur spontaneously.

A tenth aspect of the invention is the preparation of compounds according to either the second or sixth aspects by reaction of a  
 5 compound of formula VI:

with a compound of formula I according to the first aspect, where T, n, L and O are as defined in these aspects, and W is H or an atom or group for providing a functional group capable of reaction with -COOH or -NH<sub>2</sub>. This reaction will include the necessary protection  
 10 and deprotection steps so as to selectively achieve a compound according to the second or sixth aspect.

An eleventh aspect of the invention relates to compounds of formula VII:

15 wherein:

O, T, and L are as defined in the second aspect of the invention;  
 n and m are positive integers, or one of them may be zero;  
 T' is a combinatorial unit, where each T' may be different if m is greater than 1;

20 T'' is a combinatorial unit which provides a site for the attachment of D;

D is selected from:

(a)

wherein A, B, Y, Y', R<sub>2</sub> and R<sub>7</sub> are as defined in the first or second aspects of the invention; or

(b)

wherein  $X'$  is selected from CO, NH, S, or O;

G is O, S, NH, or a single bond;

5  $R'_2$  and  $R'_3$  are independently selected from: H, R, OH, OR, =O, =CH-R, =CH<sub>2</sub>, CH<sub>2</sub>-CO<sub>2</sub>R, CH<sub>2</sub>-CO<sub>2</sub>H, CH<sub>2</sub>-SO<sub>2</sub>R, O-SO<sub>2</sub>R, CO<sub>2</sub>R, COR and CN, and there is optionally a double bond between C<sub>2</sub> and C<sub>3</sub>;

$R'_6$ ,  $R'_7$ , and  $R'_9$  are independently selected from H, R, OH, OR, halo, nitro, amino, Me<sub>3</sub>Sn;

10  $R'_{11}$  is either H or R;

Q' is S, O or NH;

$R'_{10}$  is a nitrogen protecting group;

$Y''$  is a divalent group such that  $HY = R$ ;

p is a positive integer, where if p is greater than 1, for each  
15 repeating unit, the meaning of T, T', T'' and D and the values of n and m are independently selected; and

E is selected from the same possibilities as D, provided that at least one group D or E is selected from (a).

20 If, for example, D terminates with CO then the site on T'' may be NH, and if D terminates with NH, S or O, then the site on T'' may be CO.

A twelfth aspect of the invention relates to compounds of formula (VIII):

wherein L, T, T', T'', D, E, n, m and p are as defined in the eleventh aspect of the invention.

A thirteenth aspect of the invention relates to compounds of formula 5 (IX):

wherein O, L, T, T', T'', n, m and p are as defined in the eleventh aspect of the invention;

T''' is a combinatorial unit;

q is a positive integer, where if q is greater than 1, each T''' may be different; and

E<sub>a</sub> is selected from the group (a) of E as defined in the eleventh aspect of the invention;

where if p is greater than 1, for each repeating unit the meaning of T, T', T'', T''' and the values of n, m and q are independently selected.

A fourteenth aspect of the invention relates to compounds of formula (X):

wherein L, T, T', T'', T''', E<sub>a</sub>, n, m, p and q are as defined in the thirteenth aspect of the invention.

It is recognised that the compounds of formulae I, II, II', III, III', IV, IV', V, V', VII, VIII, IX and X may exist in different enantiomeric or diastereomeric forms. In such cases it is to be understood that the above formulae represent any possible

---

5 ~~enantiomeric or diastereomeric form or a mixture thereof.~~

#### Solid support

The term 'solid support' refers to a material having a rigid or semi-rigid surface which contains or can be derivatized to contain

10 reactive functionalities which can serve for covalently linking a compound to the surface thereof. Such materials are well known in the art and include, by way of example, silicon dioxide supports containing reactive Si-OH groups, polyacrylamide supports, polystyrene supports, polyethyleneglycol supports, and the like.

15 Such supports will preferably take the form of small beads, pins/crowns, laminar surfaces, pellets, disks. Other conventional forms may also be used.

#### Linker group

20 The linking groups suitable for the present application are ones which usually provide in the structure:

at least one covalent bond which can be readily broken by specific chemical reactions (or by light or changes in pH) thereby providing for liberation of compounds free from the solid support. The

25 methods employed to break the covalent bond are selected so as to be specific for the desired bond breakage thereby preventing unintended reactions from occurring elsewhere on the complex. The linking group is selected relative to the synthesis of the compounds to be formed on the solid support so as to prevent premature cleavage of

30 this compound from the solid support as well as to limit interference by any of the procedures employed during compound synthesis on the support.

Examples of resins incorporating cleavable linking groups are set

35 out in the table below, which also indicates the groups that can be

immobilised thereon, along with the suggested cleavage methods for the linking group. Such resins are commercially available (e.g. from NovaBiochem).

5	Linker/Resin Type	Immobilises	Cleavage Method
	2-Chlorotrityl chloride	RNH <sub>2</sub> , RCO <sub>2</sub> H, ROH, RSH	1-50% TFA
	Trityl chloride	RNH <sub>2</sub> , RCO <sub>2</sub> H, ROH, RSH	1-5% TFA
10	2-Methoxytrityl chloride	RNH <sub>2</sub> , RCO <sub>2</sub> H, ROH, RSH	1-5%
	Rink amide resin	RCO <sub>2</sub> H	95% TFA
15	Sieber amide resin	RCO <sub>2</sub> H	1% TFA
	4-Sulfamyl-benzoyl	RCO <sub>2</sub> H	Alkylation /amines
	Wang resin	ROH, ArOH, RNH <sub>2</sub> , RCO <sub>2</sub> H	15-95% TFA or DDQ or CAN
	HMPB-BHA	ROH, ArOH, RCO <sub>2</sub> H	1% TFA
20	Bromoethyl photolinker	RNH <sub>2</sub> , RCO <sub>2</sub> H, ROH, RSH	hν
	Hydroxy ethyl photolinker	RCO <sub>2</sub> H	hν
25	Aminoethyl photolinker	RCO <sub>2</sub> H	hν

## Structures

D = Cl: 2-chlorotrityl chloride type  
 D = H: trityl chloride type  
 D = OMe: 2-methoxytrityl chloride

Rink amide type

Sieber amide type

4-sulfamyl-benzoyl type

Wang type

HMPB-BHA type

D = NH<sub>2</sub>: amino-ethyl type  
 D = OH: hydroxy-ethyl type  
 D = Br: bromo ethyl type

For CPI precursors the most preferred linking group is one which may be deemed photolytically. Further the Rink amide linker is particularly suitable.

It is also possible that the linking group is a simple functionality provided on the solid support, e.g. amine, and in this case the linking group may be not be readily cleavable. This type of linking group is useful in the synthesis of large split and mix libraries

~~5 which will be subjected to on-bead screening (see below), where~~  
cleavage is unnecessary. Such resins are commercially available from a large number of companies including NovaBiochem, ChemTech and Rapp Polymere. These resins include amino-Tentagel and aminomethylated polystyrene resin.

10

### Combinatorial Unit

The term 'combinatorial unit' means any monomer unit which can be used to build a chain attached to the solid support, usually by a linking group. Examples of molecules suitable for such chain building are found in Schreiber et al. (*JACS*, 120. 1998, pp.23-29), which is incorporated herein by reference. An important example of a unit is an amino acid residue. Chains may be synthesised by means of amine-protected amino acids. Fmoc protected amino-acids are available from a number of sources, such as Sigma and Nova Biochem.

20 Both natural and unnatural amino acids can be used, e.g. D- and L-amino acids and heterocyclic amino acids. In particular, heterocyclic amino acids of the type found in the construction of netropsin and distamycin are of interest because of their DNA-recognition properties.

25

Amine units can be used to make up peptoids: see Soth, M.J. and Nowick, J.S. 1997, Unnatural oligomer libraries, *Curr. Opin. Chem. Biol.* 1, no. 1: 120-129; Zuckermann et al., 1994, Discovery of Nanomolecular Ligands for 7-Transmembrane G-Protein-Coupled

30 Receptors from a Diverse N-(Substituted)glycine Peptoid Library, *Journal of Medicinal Chemistry* 37: 2678-85; Figliozzi, GMR et al., 1996, Synthesis of N-substituted Glycine Peptoid Libraries, *Methods in Enzymology*, 267: 437-47; Simon, R J et al., 1992, Peptoids: A Modular Approach to Drug Discovery, *Proc. Natl. Acad. Sci. USA*,  
35 89:9367-71; which are all incorporated herein by reference.

Other combinatorial units include PNAs (peptidonucleic acids): PE Nielsen, et al, *Science*, 1991, 254, 1497; M Egholm, et al, *Nature*,

1993, 365, 566; M Egholm et al, JACS, 1992, 114, 1895; S C Brown, et al, Science, 1994, 265, 777; S. K Saha, et al, JOC, 1993, 58, 7827; oligoureas: Burgess K, et al, 1995, Solid Phase Synthesis of Unnatural Biopolymers Containing Repeating Urea Units. Agnew. Chem.

Synthesis of Oligoureas; *Journal of the American Chemical Society*

119: 1556-64; and oligocarbamates: Moran E J et al, 1995, Novel

Biopolymers for Drug Discovery. *Biopolymers (Peptide Science)*; John Wiley and Sons 37: 213-19; Cho C Y et al, 1993, An Unnatural

10 Biopolymer. *Science* 261: 1303-5; Paikoff S F et al, 1996, The Solid Phase Synthesis of N-Alkylcarbamate Oligomers. *Tetrahedron Letters* 37, no. 32: 5653-56. All of these documents are incorporated herein by reference.

15 A further aspect of the present invention relates to combinatorial units having formula I, where the fused ring collectively represented by A and B is substituted by CO<sub>2</sub>R.

Further combinatorial units of relevance to this invention are those

20 of formulae (XIa/b):

The present invention relates to libraries, or collections, of compounds, all of which are represented by a single one of the formulae II, II', III, III', IV, IV', V, V', VII, VIII, IX or X.

The diversity of the compounds in a library may reflect the presence

~~5 of compounds differing in the identities of one or more of (as~~  
 appropriate) X, Y, Y', A, B, R<sub>2</sub>, R<sub>7</sub>, X', Y'', G, R'<sub>2</sub>, R'<sub>3</sub>, R'<sub>6</sub>, R'<sub>7</sub>,  
 R'<sub>9</sub>, R'<sub>10</sub>, Q', R'<sub>11</sub> and/or in the identities of the combinatorial  
 units T, T', T'' and T''' (when present). The number of members in  
 the library depends on the number of variants, and the number of  
 10 possibilities for each variant. For example, if it is the  
 combinatorial units which are varied, and there are 3 combinatorial  
 units, with 3 possibilities for each unit, the library will have 27  
 compounds. 4 combinatorial units and 5 possibilities for each unit  
 gives a library of 625 compounds. If, for instance, there is a  
 15 chain of 5 combinatorial units with 17 possibilities for each unit,  
 the total number of members in the library would be 1.4 million. A  
 library may therefore comprise more than 1 000, 5 000, 10 000,  
 100 000 or a million compounds, which may be arranged as described  
 below.

20 In the case of free compounds (formulae II, II', IV, IV', VIII, X)  
 the individual compounds are preferably in discrete volumes of  
 solvents, e.g. in tubes or wells. In the case of bound compounds  
 (formulae III, III', V, V', VII, IX) the individual compounds are  
 preferably bound at discrete locations, e.g. on respective  
 25 pins/crowns or beads. The library of compounds may be provided on a  
 plate which is of a suitable size for the library, or may be on a  
 number of plates of a standard size, e.g. 96 well plates. If the  
 number of members of the library is large, it is preferable that each  
 well on a plate contains a number of related compounds from the  
 30 library, e.g. from 10 to 100. One possibility for this type of  
 grouping of compounds is where only a subset of the combinatorial  
 units, or substituents, are known and the remainder are randomised;  
 this arrangement is useful in iterative screening processes (see  
 below). The library may be presented in other forms that are  
 35 well-known.

A further aspect of the present invention is a method of preparing a  
 diverse collection, or library of compounds, as discussed above. If

the diversity of the library is in the combinatorial units, then the library may be synthesised by the stepwise addition of protected combinatorial units to a CPI/CBI precursor core, each step being interposed by a deprotection step. Such a method is exemplified  
5 later. Libraries of this type can be prepared by the method known as

"split and mix" which is described in Furka, A; Sebestyen, F; Asgedom, M and Dibo, G; General Method of Rapid Synthesis of Multicomponent Peptide Mixtures; International Journal of Peptide and Protein Research; 1991, 37, 487-193, which is incorporated herein by  
10 reference. If the diversity of the library is in the substituent groups, the library may be synthesised by carrying out the same synthetic methods on a variety of starting materials or key intermediates, which already possess the necessary substituent patterns.

15

The present invention also relates to a method of screening the compounds of formula II, II', III, III', IV, IV', V, V', VII, VIII, IX or X to discover biologically active compounds. The screening can be to assess the binding interaction with nucleic acids, e.g. DNA or  
20 RNA, or proteins, or to assess the affect of the compounds against protein-protein or nucleic acid-protein interactions, e.g. transcription factor DP-1 with E2F-1, or estrogen response element (ERE) with human estrogen receptor (a 66 kd protein which functions as hormone-activated transcription factor, the sequence of which is  
25 published in the art and is generally available). The screening can be carried out by bringing the target macromolecules into contact with individual compounds or the arrays or libraries of individual compounds described above, and selecting those compounds, or wells with mixtures of compounds, which show the strongest effect.

30

This effect may simply be the cytotoxicity of the compounds in question against cells or the binding of the compounds to nucleic acids. In the case of protein-protein or nucleic acid-protein interactions, the effect may be the disruption of the interaction  
35 studied.

The binding of the compounds to nucleic acids may be assessed by labelling oligomers which contain a target sequence, and measuring

the amount of labelled oligomers that bind to the compounds tested.  
● The labelling may either be radiolabelling, or alternatively be labels detectable under visible or ultra-violet light. If this latter form of screening is carried out on compounds bound to solid supports which are in separate locations, the screening for results can be carried out visually under a microscope. A similar technique is described in detail in DNA-Binding ligands from peptide libraries containing unnatural amino acids, Lescrinier *et al.*, *Chem Eur J*, 1998, 425-433. These techniques are particularly suited to a one-step screening of a complete library of compounds, especially a large library made by the "split and mix" method described above.

Protein-protein interactions can be measured in a number of ways, e.g. FRET (fluorescence resonance energy transfer) which involves labelling one of the proteins with a fluorescent donor moiety and the other with an acceptor which is capable of absorbing the emission from the donor; the fluorescence signal of the donor will be altered depending on the interaction between the two proteins. Another method of measuring protein-protein interactions is by enzymatic labelling, using, for example, horseradish peroxidase.

The screening process may undergo several iterations by selecting the most active compounds, or group of compounds, tested in each iteration; this is particularly useful when testing arrays of wells which include mixtures of related compounds. Furthermore, if the wells contain compounds for which only a subset of the combinatorial units, or substituents, are known, but the rest are randomised, subsequent iterations can be carried out by synthesising compounds possessing the selected known (and successful) combinatorial unit, or substituent, pattern, but with further specified combinatorial units, or substituents, replacing the previously randomised combinatorial units, or substituents, adjacent the already known pattern; the remaining combinatorial units, or substituents, are randomised as in the previous iteration. This iterative method enables the identification of active members of large libraries without the need to isolate every member of the library.

A further feature of this aspect is formulation of selected compound

or compounds with pharmaceutically acceptable carriers or diluents.

In yet further aspects, the invention provides a pharmaceutical composition comprising a compound of formula II, II', IV, IV', VIII

5 or X and a pharmaceutically acceptable carrier or diluent; and the

use of a compound of formula II, II', IV, IV', VIII or X in the manufacture of a medicament for the treatment of a gene-based disease, or a bacterial, parasitic or viral infection. Gene-based

10 disease include neoplastic disease and, for example, Alzheimer's

Compounds of formula II, II', IV, IV', VIII or X may be used in a method of therapy against a gene-based disease, such as cancer or Alzheimer's disease, or a viral, parasitic or bacterial infection.

15

Another aspect of the present invention relates to the use of compounds of formula III, III', V, V', VII or IX in diagnostic methods. A compound of formula III, III', V, V', VII or IX which binds to an identified sequence of DNA or a protein known to be an

20 indicator of a medical condition can be used in a method of

diagnosis. The method may involve passing a sample, e.g. of appropriately treated blood or tissue extract, over an immobilised compound of formula III, III', V, V', VII or IX, for example in a column, and subsequently determining whether any binding of target

25 DNA to the compound of formula III, III', V, V', VII or IX has

taken place. Such a determination could be carried out by passing a known amount of labelled target DNA known to bind to compound III, III', V, V', VII or IX through the column, and calculating the amount of compound III, III', V, V', VII or IX that has remained

30 unbound.

A further aspect of the present invention relates to the use of compounds of formula II, II', IV, IV', VIII or X in target validation. Target validation is the disruption of an identified

35 DNA sequence to ascertain the function of the sequence, and a

compound of formula II, II', IV, IV', VIII or X can be used to selectively bind an identified sequence, and thus disrupt its

function.

Another aspect of the present invention relates to the use of compounds of formulae II, II', IV, IV', VIII or X in functional

~~5 genomics to ascertain the biological function of genes, by blocking~~  
this biological action.

#### Preferred Synthetic Strategies

Compounds of formula I can be synthesised by applying the methods  
10 described below. A review of methods of synthesising CPIs was carried out by Boger (Boger, D.L. et al., J.A. Chem. Rev. 1997, 97, 787-828)

#### **Boger Synthesis of N-BOC-CBI**

15 Selective C4 iodination of N-BOC-4-(benzyloxy)naphthylamine, readily accessible in three steps from the commercially available 1,3-dihydroxynaphthalene, followed by N-alkylation with allyl bromide provided the required substrate for the 5-exo-trig aryl radical-alkene cyclization (Boger, D.L. et al., O. J. Am. Chem.  
20 Soc. 1989, 111, 6461-6463. Boger, D.L. et al., O. J. Org. Chem. 1990, 55, 5823-5832) (Scheme 1). Treatment with Bu<sub>3</sub>SnH-TEMPO (Boger, D.L.; McKie, J.A. J. Org. Chem. 1995, 3, 1429-1453) and subsequent reduction with Zn afforded the 3-(hydroxymethyl)indoline CBI precursor. Conversion to the primary chloride and catalytic  
25 hydrogenolysis of the benzyl ether, followed by direct resolution on a semipreparative chiral HPLC column afforded both enantiomers (Boger, D.L.; Yun, W. J. Am. Chem. Soc. 1994, 116, 7996-8006). Subsequent spirocyclization completed the synthesis.

Scheme 1

**Reagents and conditions:** a:  $\text{NH}_3$ ,  $\text{BOC}_2\text{O}$ ;  $\text{BnBr}$ ; b:  $\text{NIS}$ ; c:  $\text{AllylBr}$ ,  $\text{NaH}$ ; d:  $\text{Bu}_3\text{SnH}$ ,  $\text{TEMPO}$ ; e:  $\text{Zn}$ ; f:  $\text{Ph}_3\text{P-CCl}_4$ ; g:  $\text{H}_2$ ,  $\text{Pd-C}$ ; h:  $\text{NaH}$

5

#### Cava synthesis of CBI

Cava's route to CBI uses a heterocyclization procedure involving a heterostilbene to establish the tricyclic CBI core, followed by introduction of an additional functionalized carbon necessary for formation of the cyclopropane (Drost, K.J.; Cava, M.P. *J. Org. Chem.* **1991**, *56*, 2240-2244) (Scheme 2).

Scheme 2

Reagents and conditions: **a**: 1) *t*-BuOK; 2) *p*-nitrobenzoic acid, Et<sub>3</sub>N, Pd-C, hn; **b**: 1) NaBH<sub>3</sub>CN; 2) ClCO<sub>2</sub>CH<sub>2</sub>CCl<sub>3</sub>; **c**: 1) DDQ; 2) NaBH<sub>4</sub>; **d**: Me<sub>2</sub>NH, CH<sub>2</sub>O; **e**: CH<sub>3</sub>I; NaCN; **f**: NaOH; **g**: 1) MeO<sub>2</sub>CCl, Et<sub>3</sub>N; 2) NaBH<sub>3</sub>CN; 3) TCBOC-Cl, Et<sub>3</sub>N; **h**: NaOH; **i**: 1) (COCl)<sub>2</sub>; 2) mercaptopyridine-N-  
5 oxide, DMAP, CCl<sub>4</sub>; **j**: BCl<sub>3</sub>·SMe<sub>2</sub>; Et<sub>3</sub>N

Thus, photolysis of the alkene formed from condensation of the  $\alpha$ -methoxybenzyl phosphonate with *N*-benzylpyrrole-2-carboxaldehyde in  
10 the presence of Pd-C provided the tricyclic CBI core (Rawal, V.H.; Jones, R.J.; Cava, M.P. *J. Org. Chem.* **1987**, *52*, 19-28). A four step debenzylation sequence followed by a regioselective Mannich alkylation was employed to provide the key CBI intermediate.

#### 15 **Aristoff synthesis of CBI** (Scheme 3)

An alternative approach to the CBI subunit was described by Aristoff and coworkers (Aristoff, P.A.; Johnson, P.D.; Sun, D. *J. Med. Chem.* **1993**, *36*, 1956-1963. Aristoff, P.A.; Johnson, P.D. *J. Org. Chem.* **1992**, *57*, 6234-6239). 1-Allyl-2-(benzylamino)-1-  
20 hydroxydihydronaphthalenone was prepared in two steps from 1,4-naphthoquinone. Reduction and re-aromatization was accomplished by treatment with BOC<sub>2</sub>O followed by sodium dithionite. The racemic diol was prepared by OsO<sub>4</sub>-catalyzed dihydroxylation. Deprotection of the benzylamine, *N*- and *O*-acetylation, acetate hydrolysis, followed by  
25 selective mesylation of the primary alcohol and TMS ether protection of the secondary alcohol preceded 6-membered ring closure upon treatment with NaH. Alcohol deprotection and resolution by chromatographic separation of the diastereomeric (*R*)-*O*-acetylmandelate esters provided the optically active materials.

Scheme 3

**Reagents and conditions:** a:  $\text{BnNH}_2$ ; b: Allyl MgBr; c:  $\text{BOC}_2\text{O}$ ;  $\text{Na}_2\text{S}_2\text{O}_4$ ; d:  $\text{OsO}_4$ , NMO; e:  $\text{HCO}_2\text{H}$ , Pd-C;  $\text{Ac}_2\text{O}$ ; f:  $\text{K}_2\text{CO}_3$ ; g: TMSCl, pyridine; h: NaH; j:  $\text{K}_2\text{CO}_3$ ; k: (R)-O-acetylmandelic acid, EDCI; Resolution;  $\text{K}_2\text{CO}_3$ ; i: MsCl, Et<sub>3</sub>N; l: TFA; m: NaH

5

Primary alcohol activation, BOC deprotection, and transannular cyclization upon treatment with NaH provided the CBI accompanying hydrolysis of the intermediate N-Ac-CBI by water present in the reaction mixture.

10

Any of these three routes may be adapted to synthesise compounds according to the first aspect of the present invention, for example by starting with appropriately substituted starting materials (which may be protected), or by introducing substituents at a later

15 stage.

#### Preferred Synthetic Strategies of pyrrolo[2,1-c][1,4]benzodiazepines

A key step in a preferred route to compounds corresponding to the group D(b) of the eleventh aspect of the invention or combinatorial units of formulae **XIa** and **XIb** is a cyclisation process to produce the B-ring, involving generation of an aldehyde (or functional equivalent thereof) at what will be the 11-position, and attack thereon by the pro-10-nitrogen:

In this structure, D represents XY, or a masked form thereof. The "masked aldehyde" -CPQ may be an acetal or thioacetal (possibly cyclic), in which case the cyclisation involves unmasking. Alternatively, the masked aldehyde may be an aldehyde precursor such as an alcohol -CHOH, in which case the reaction involves oxidation, e.g. by means of TPAP or DMSO (Swern oxidation).

30

The masked aldehyde compound can be produced by condensing a corresponding 2-substituted pyrrolidine with a 2-nitrobenzoic acid:

The nitro group can then be reduced to  $-NH_2$  and protected by reaction with a suitable agent, e.g. a chloroformate, which provides the removable nitrogen protecting group in the desired compound.

A process involving the oxidation-cyclization procedure is illustrated in scheme 4 (an alternative type of cyclisation will be described later with reference to scheme 5).

Scheme 4

If  $R'_{11}$  is other than hydrogen, the final compound may be prepared by direct etherification of the alcohol. Compounds with  $Q' = S$  can be prepared by treatment of the corresponding alcohol with  $R'_{11}SH$ , and a catalyst (usually a Lewis Acid such as  $Al_2O_3$ ). If  $Q' = NH$ ,

then these compounds can be prepared by reacting the alcohol with an amine  $R'_{11}NH$  and a catalyst (usually a Lewis Acid).

Exposure of the alcohol **B** (in which the 10-nitrogen is generally ~~5-protected as an amide carbamate) to tetrapropylammonium~~ perruthenate (TPAP)/N-methylmorpholine N-oxide (NMO) over A4 sieves results in oxidation accompanied by spontaneous B-ring closure to afford the desired product. The TPAP/NMO oxidation procedure is found to be particularly convenient for small scale reactions while  
10 the use of DMSO-based oxidation methods, particularly Swern oxidation, proves superior for larger scale work (e.g. > 1 g).

The uncyclized alcohol **B** may be prepared by the addition of a nitrogen protecting reagent of formula **D**, which is preferably a  
15 chloroformate or acid chloride, to a solution of the amino alcohol **C**, generally in solution, generally in the presence of a base such as pyridine (preferably 2 equivalents) at a moderate temperature (e.g. at 0°C). Under these conditions little or no O-acylation is usually observed.

20

The key amino alcohol **C** may be prepared by reduction of the corresponding nitro compound **E**, by choosing a method which will leave the rest of the molecule intact. Treatment of **E** with tin (II) chloride in a suitable solvent, e.g. refluxing methanol,  
25 generally affords, after the removal of the tin salts, the desired product in high yield.

Exposure of **E** to hydrazine/Raney nickel avoids the production of tin salts and may result in a higher yield of **C**, although this  
30 method is less compatible with the range of possible **C** and A-ring substituents. For instance, if there is C-ring unsaturation (either in the ring itself, or in  $R_2$  or  $R_3$ ), this technique may be unsuitable.

35 The nitro compound of formula **E** may be prepared by coupling the appropriate o-nitrobenzoyl chloride to a compound of formula **F**, e.g. in the presence of  $K_2CO_3$  at -25°C under a  $N_2$  atmosphere.

Compounds of formula F can be readily prepared, for example by olefination of the ketone derived from L-trans-4-hydroxy proline. The ketone intermediate can also be exploited by conversion to the enol triflate for use in palladium mediated coupling reactions.

5 The o-nitrobenzoyl chloride is synthesised from the o-nitrobenzoic acid (or alkyl ester after hydrolysis) of formula G, which itself is prepared from the vanillic acid (or alkyl ester) derivative H. Many of these are commercially available and some are disclosed in  
 10 Althuis, T. H. and Hess, H. J., *J. Medicinal Chem*, 20(1), 146-266 (1977).

#### Alternative Cyclisation (Scheme 5)

Scheme 5

15

In scheme 4, the final or penultimate step was an oxidative cyclisation. An alternative approach, using thioacetal coupling/unmasking, is shown in scheme 5. Mercury-mediated unmasking causes cyclisation to the desired compound.

20

The thioacetal intermediates may be prepared as shown in scheme 2:

the thioacetal protected C-ring [prepared via a literature method: Langley, D.R. & Thurston, D.E., *J. Organic Chemistry*, **52**, 91-97 (1987)] is coupled to the o-nitrobenzoic acid (or alkyl ester after hydrolysis) **6** using a literature procedure. The resulting nitro

---

5 compound cannot be reduced by hydrogenation, because of the thioacetal group, so the tin(II) chloride method is used to afford the amine. This is then N-protected, e.g., by reaction with a chloroformate or acid chloride, such as *p*-nitrobenzylchloroformate.

10 Acetal-containing C-rings can be used as an alternative in this type of route with deprotection involving other methods including the use of acidic, or perhaps Lewis Acid, conditions.

In the above synthesis schemes, the derivatisation of the A-ring is  
15 shown as being complete before the compounds are attached to the solid support. This is preferred if the substituents are groups such as alkoxy or nitro. On the other hand, substituent groups such as alkyl or alkenyl could be added to the A-ring after the coupling of the compound to the solid support. This may be  
20 achieved by R<sup>6</sup>, R<sup>7</sup>, or R<sup>8</sup>, being easily replaceable groups, such as a halogen atom.

An alternative synthesis approach to those detailed above is to protect the Pro N10 position on the component which will form the  
25 A-ring before joining the component which will form the C-ring.

Embodiments of the present invention will now be described by way of example.

Example 1: CBI bound to TG-Carboxy resinActivation of TG-Carboxy resin with 3-hydroxy-1,2,3-benzotriazin-4(3H)-one (HO-Dhbt)

TG Carboxy resin (Nova-Biochem, 80 mg 0.020 mmol) was suspended and

5 swollen in DMF (1 mL) for 10 minutes. DMF was removed by suction and the resin treated with diisopropyl carbodiimide (DIC) (34 mmL, 10 eq) in DMF (1 mL). The mixture was shaken for 15 minutes at -15°C (acetone-ice bath), then rinsed with DMF (2 x 1 mL).

10 The resin was suspended in DMF (1 mL), cooled to -10°C and treated with HO-Dhbt (33 mg, 10 eq). The mixture was shaken for 30 minutes at -10°C, followed by 4 hours shaking at 0°C and was then allowed to stand at 0°C overnight.

15 The reaction mixture was filtered and the resin washed with DMF (2 x 1 mL), dichloromethane (2 x 1 mL), MeOH (2 x 1 mL) and diethyl ether (1 mL). The activated resin was stored in freezer until ready for use.

Coupling of O-Dhbt activated TG-Carboxy resin with seco-CBI, in presence of DPEA

5 Seco-CBI has a very limited storage time, and for this reason BOC-seco-CBI is deprotected immediately before coupling to the activated resin. BOC-seco-CBI (20 mg 0.06 mmol) was dissolved in HCl in anhydrous ethyl acetate (3M, 2.8 mL). The mixture was kept at 0°C for 30 minutes and then allowed to warm to room temperature  
 10 over 30 minutes. TLC (4:1 petroleum ether:diethyl ether) revealed complete reaction; the reaction mixture was evaporated under reduced pressure and stored at -20°C.

O-Dhbt activated resin (40 mg) was treated with seco-CBI dissolved  
 15 in DMF (1 mL). DPEA (3 eq, 7.7 mg, 10 mmL) was added to the suspension and the mixture was shaken for 30 minutes at room temperature. The reaction mixture was filtered and the resin was washed with DMF (1 mL), dichloromethane (1 mL), methanol (1 mL) and diethyl ether (2 x 1 mL). After thorough evaporation of solvents  
 20 the resin was stored at -20°C.

Example 2: seco-CBI bound to TG-Carboxy resin

Coupling of O-Dhbt activated TG-Carboxy resin with seco-CBI, in absence of base

BOC-seco-CBI (20 mg, 0.06 mmol) was dissolved in HCl solution in 5 anhydrous ethyl acetate (3M, 2.8 mL). The mixture was kept at 0°C for 30 minutes and then allowed to warm to room temperature over 30 minutes. TLC (4:1 = petroleum ether:diethyl ether) revealed complete reaction; the reaction mixture was evaporated at reduced pressure and directly used for the coupling without further 10 purification.

O-Dhbt-activated resin (see Example 1) (40 mg, 0.01 mmol) was treated with seco-CBI dissolved in DMF (1 mL); the mixture was agitated for 1 hour at room temperature. The reaction mixture was 15 then filtered and the resin was washed with DMF (1 mL), dichloromethane (1 mL), methanol (1 mL) and diethyl ether (2x1 mL). After thorough evaporation of excess solvent the resin was stored at -20°C.

20 Example 3 - Synthesis of a CBI - hexapeptide libraryGeneral Procedures*General procedure for acetylation/endcapping*

After each coupling step the resin was treated with a mixture of 25 pyridine (30%) and acetic anhydride (20%) in dichloromethane, to acetylate any free amino groups that had not been coupled to an

amino acid. In this way the formation of undesirable oligopeptides (carrying less than the expected number of amino acids) could be avoided.

The resin was treated with the acetylating reagent (3 mL) and the ~~5~~ slurry was agitated at room temperature for 1 hour. The reagents were then removed by filtration and the resin was rinsed with dichloromethane (2 x 5 mL) and methanol (2 x 5 mL).

*General procedure for Fmoc deprotection*

10 The resin was treated with a solution of piperidine in DMF (20%, 3 mL). The mixture was then agitated for 2 hours at room temperature. Excess solvent was then removed by suction and the resin was rinsed with DMF (2 x 5 mL), dichloromethane (2 x 5 mL) and methanol (2 x 5 mL).

15

Library Generation

*Fmoc-Glu-OAll coupled to NovaSyn TG resin*

NovaSyn TG amino resin (0.345g, load 0.29 mmol/g, 0.1 mmol) was suspended and swollen in DMF (2 mL), under agitation (1000 rpm) for 20 30 minutes. Excess solvent was then removed and a solution of Fmoc-Glu-OAll (0.123g, 0.3 mmol, 3 eq), TBTU (0.096g, 0.3 mmol, 3 eq) and DPEA (0.052 mL, 0.3 mmol, 3 eq) in DMF (3 mL) was added to the swollen resin. The resulting mixture was agitated at 1000 rpm at room temperature, overnight. The reaction mixture was filtered 25 and the resin rinsed with DMF (2 x 2 mL), dichloromethane (2 x 5 mL) and methanol (2 x 5 mL).

The resin was then acetylated (see General procedure for acetylation) and deprotected (see General procedure for Fmoc 30 deprotection).

*HO-Gly-Fmoc coupled to P-Glu(OAll)-H*

The resin was suspended in DMF (2 mL) and allowed to swell for 30 minutes at room temperature, accompanied by agitation (1000 rpm). Excess DMF was removed and a solution of Fmoc-Gly-OH (0.089 g, 0.3 mmol, 3 eq), TBTU (0.096 g, 0.3 mmol, 3 eq) and DPEA (0.052 mL, 0.3 mmol, 3 eq) in DMF (3 mL) was added to the resin. The mixture was allowed to shake at room temperature for 12 hours. Excess reagents were then removed by filtration and the resin was rinsed with DMF (2 x 5 mL), dichloromethane (2 x 5 mL) and methanol (2 x 5 mL). The resin was then acetylated (see General procedure for 10 acetylation) and deprotected (see General procedure for Fmoc deprotection) to afford the resin-bound dipeptide P-Glu(OAll)-Gly-H.

Split & Mix procedure for the resin bound hexapeptide

15 P-Glu(OAll)-Gly-X<sub>1</sub>X<sub>2</sub>X<sub>3</sub>X<sub>4</sub>-H sublibrary

The resin was suspended in 3:1 mixture of 1,2-dichloroethane (DCE) and DMF and equally partitioned into 17 4mL Alltech tubes. Each 20 tube thus contained  $0.1/17 \text{ mmol} = 5.88 \cdot 10^{-6} \text{ mol}$  of resin-bound dipeptide. Excess solvent was removed in vacuo, and the resin was suspended in DMF (200 mL) and agitated for 30 minutes. The 17 aminoacids ( $1.76 \cdot 10^{-5} \text{ mmol}$ , 3 eq for each step,  $7.04 \cdot 10^{-5} \text{ mmol}$  for 4 steps) were weighed into 17 vials:

25

Fmoc-Ala-OH	22 mg	Fmoc-Met-OH	26 mg
Fmoc-Asn-OH	25 mg	Fmoc-Phe-OH	27 mg
Fmoc-Asp(OtBu)-OH	29 mg	Fmoc-Pro-OH	24 mg
Fmoc-Gln-OH	26 mg	Fmoc-Ser(tBu)-OH	27 mg
30 Fmoc-Glu(OtBu)-OH	30 mg	Fmoc-Thr(tBu)-OH	28 mg
Fmoc-Gly-OH	21 mg	Fmoc-Trp(BOC)-OH	37 mg
Fmoc-Ile-OH	25 mg	Fmoc-Tyr(tBu)-OH	32 mg
Fmoc-Leu-OH	25 mg	Fmoc-Val-OH	24 mg
Fmoc-Lys(BOC)-OH	33 mg		

Each amino acid was dissolved in DMF (2 mL); an aliquot of each solution (0.5 mL, corresponding to  $1.76 \cdot 10^{-5}$  mmol, 3 eq of each amino acid) was added to the appropriate tube. TBTU ( $1.76 \cdot 10^{-5}$  mmol  ~~$5 \cdot 10^{-5}$  mmol, 56 mg~~) and DPEA ( $1.76 \cdot 10^{-5}$  mmol  ~~$5 \cdot 10^{-5}$  mmol, 52 mg~~) were separately dissolved in DMF (1.7 mL) and each solution was evenly distributed, delivering 3 eq of each reagent, to each one of the 17 tubes.

10 The reaction tubes were agitated at room temperature for 12 hours, then the reagents and solvents were removed *in vacuo* and the resin was rinsed with DMF (2 x 1 mL each tube), DCM (2 x 1 mL each tube) and methanol (2 x 1 mL each tube). The resin was then suspended in 3:1 mixture of 1,2-dichloroethane and DMF and recombined. The  
15 recombined resin was acetylated (3 mL of acetylating reagent, 1 hour, room temperature) and deprotected (3 mL of 20% piperidine in DMF, 2 hours, room temperature).

The procedure was repeated 3 more times. At the end of the 4<sup>th</sup>  
20 amino acid coupling the deprotection step was not executed.

#### Deprotection of Allyl ester

The resin was suspended in DCM (2 mL), phenylsilane (2.4 mmol, 24  
25 eq, 0.29 mL) in DCM (1 mL) of was added and the mixture was shaken at room temperature for 10 minutes.

A catalytic amount of Pd[PPh<sub>3</sub>]<sub>4</sub> (0.01 mmol, 0.1 eq, 11 mg) in DCM (0.5 mL) was added and the reaction mixture was shaken for further  
30 10 minutes.

The reagents were filtered and the resin was rinsed with DCM (2 x 5 mL) and methanol (2 x 5 mL). The procedure was repeated once again and the resin was finally dried under reduced pressure.

Activation of resin with 3-hydroxy-1,2,3-benzotriazin-4(3H)-one (HO-Dhbt)

The resin was suspended and swollen in DMF (2 mL) for 10 minutes. Excess DMF was removed and the resin was treated with a solution of 5 diisopropyl carbodiimide (DIC) (156 mL 1 mmol, 10 eq) in DMF (2 mL). The resulting slurry was shaken for 15 minutes at  $-15^\circ\text{C}$  (acetone-ice bath), then washed with DMF (2 x 2 mL).

The resin was resuspended in DMF (2 mL), cooled to  $-10^\circ\text{C}$  and 10 treated with HO-Dhbt (163 mg 1 mmol, 10 eq). The mixture was shaken for 30 minutes at  $-10^\circ\text{C}$ , followed by 4 hours at  $0^\circ\text{C}$  and then allowed to stand at  $0^\circ\text{C}$  overnight.

The reaction mixture was filtered and the resin washed with DMF (2 15 x 2 mL), dichloromethane (2 x 2 mL), MeOH (2 x 2 mL) and diethyl ether (2 mL). The activated resin was stored in freezer until required for use.

Coupling of O-Dhbt activated resin with seco-CBI, in presence of  
20 DPEA

BOC-seco-CBI (see example 2) was deprotected immediately before coupling to the activated resin. BOC-seco-CBI (100 mg, 0.3 mmol) 25 was dissolved in a solution of HCl in anhydrous ethyl acetate (3M, 15 mL). The mixture was cooled at  $0^\circ\text{C}$  for 30 minutes and then allowed to warm to room temperature over 30 minutes. TLC (4:1 = petroleum ether:diethyl ether) revealed complete reaction; the reaction mixture was evaporated under reduced pressure and stored 30 at  $-20^\circ\text{C}$ .

O-Dhbt-activated resin was treated with *seco*-CBI dissolved in DMF (2 mL) and the mixture was shaken for 60 minutes at room temperature. The reaction mixture was filtered and the resin was washed with DMF (2 x 2 mL), dichloromethane (2 x 2 mL), methanol (2 x 2 mL) and diethyl ether (2 x 1 mL). The resin was dried under reduced pressure and stored in a cool, dry place.

#### t-Butyl- and BOC- deprotection on side chains

The resin was treated with a solution of TIS/TFA in dichloromethane (2%, 2 mL). The mixture was shaken for 2 hours at room temperature. Excess reagents were removed *in vacuo* and the resin was rinsed with dichloromethane (2 x 5 mL) and methanol (2x5 mL).

#### Fmoc deprotection

15

The resin was treated with of a solution of piperidine in DMF (20%, 3 mL), and agitated at room temperature for 2 hours. The mixture was filtered and the resin was washed with DMF (2 x 5 mL), dichloromethane (2 x 5 mL) and methanol (2 x 5 mL). The resin was then dried under reduced pressure.

#### 25 Example 4: Synthesis of A CBI Combinatorial Building Block: 7-carboxy-1,2,9,9a-tetrahydrocyclopropa [c]benzo[e]indol-4-one

The synthesis proceeds from a modified Stobbe condensation/Friedel-Crafts acylation for generation of the functionalised precursor, followed by 5-*exo-trig* aryl radical-alkene cyclization.

30

Wadsworth-Horner-Emmons condensation of 3-bromo-benzaldehyde with the Sargent phosphonate predominantly provides the E-isomer, which in turn undergoes acid-catalyzed deprotection and Friedel-Crafts acylation (Scheme 6).

35

Scheme 6

**Reagents and conditions:** **a:** NaH, Sargent phosphonate; **b:** TFA; **c:** 1)  $\text{Ac}_2\text{O-KOAc}$ ; 2)  $\text{K}_2\text{CO}_3$ ; 3)  $\text{BnBr, K}_2\text{CO}_3$ ; **d:**  $\text{CuCN}$ ; **e:** 1)  $\text{LiOH}$ ; 2)  $\text{DPPA, } t\text{-BuOH}$ ; **f:**  $\text{NIS}$ ; **g:**  $\text{allyl Br, NaH}$ ; **h:**  $\text{Bu}_3\text{SnH, TEMPO}$ ; **i:**  $\text{Zn-HOAc}$ ; **j:**  $\text{Ph}_3\text{P-CCl}_4$ ; **k:**  $\text{NaOH}$

Aromatic nucleophilic substitution, ester hydrolysis and Curtius rearrangement effected by treatment with DPPA are followed by regioselective C4 iodination and N-alkylation with allyl bromide. The aryl radical-alkene cyclization by means of TEMPO as radical trap, as described in Boger synthesis of CBI, provides the tricyclic system that, after conversion to the primary chloride and base-catalyzed hydrolysis of the cyano group, should give the desired building block for a combinatorial library.

**Example 5: Screening of CBI on bead against DNA sequence**

The CBI on bead synthesised in example 1 was screened against rhodamine labelled double stranded DNA with the sequence:

~~5-Label-5'-GCG-TAA-AAA-CGC-3'-~~

For comparison, indoline was added to O-Dhbt-activated TG Carboxy resin (as prepared in example 1) to yield a comparative resin that does not covalently interact with DNA.

10

The resin alone was also tested to provide a background measurement. The screening protocol used was:

1. Weigh out approximately 1 mg of resin into an Eppendorf.
- 15 2. Incubate the resin with annealed rhodamine labelled double strand DNA for 24 hours at 37°C.
3. After 24 h incubation wash the resin 4 times and re-suspend beads in 50 mL of TE (EDTA and Tris buffer) or PBS (phosphate buffered saline).
- 20 4. Resin was transferred to a black 96 well plate with transparent base, fluorescence was measured from below at 635 nm using a Tecan Spectrofluor (590 nm excitation, 635 nm emission).

25

Resin	Relative Fluorescence Units
TG Carboxy Resin	892
Indoline Bound to Resin	625
CBI Bound to Resin	2947

Only a small amount of DNA binding was observed with the acid resin  
 30 and with the resin loaded with an inactive indoline CBI mimic. An almost five fold differential was observed between the CBI resin and Indoline resin demonstrating DNA binding by the resin bound CBI. It is anticipated that a higher concentration of DNA would lead to a higher differential between the resins as it is possible

that the CBI-resin is not saturated with DNA at this concentration.

---

## CLAIMS

1. A compound of formula I:

wherein X is an electrophilic leaving group;

5 Y is selected from NH-Prot, O-Prot, S-Prot, NO<sub>2</sub>, NHOH, N<sub>3</sub>, NHR, NRR, N=NR, N(O)RR, NHSO<sub>2</sub>R, N=NPhR, SR or SSR, where Prot represents a protecting group;

A and B collectively represent a fused benzene or pyrrole ring (in either orientation), which is optionally substituted by up to  
10 respectively 4 or 2 groups independently selected from R, OH, OR, halo, nitro, amino, Me<sub>3</sub>Sn, CO<sub>2</sub>H, CO<sub>2</sub>R;

R<sub>1</sub> is a nitrogen protecting group, where if Y includes a protecting group, these protecting groups are orthogonal;

R<sub>2</sub> and R<sub>7</sub> are independently selected from H, R, OH, OR, halo, nitro,  
15 amino, Me<sub>3</sub>Sn;

wherein R is selected from

(a) a lower alkyl group having 1 to 10 carbon atoms,

(b) an aralkyl group (i.e. an alkyl group with one or more aryl substituents), preferably of up to 12 carbon atoms;

20 the alkyl group of (a) or (b) optionally containing one or more carbon-carbon double or triple bonds, which may form part of a conjugated system; and

(c) an aryl group, preferably of up to 12 carbon atoms; and

wherein R is optionally substituted by one or more halo, hydroxy,  
25 amino, or nitro groups, and optionally contains one or more hetero atoms, which may form part of, or be, a functional group;

except that when R<sub>1</sub> is Boc, Y is NO<sub>2</sub>, X is Cl, and R<sub>2</sub> and R<sub>7</sub> are H, then A and B do not collectively represent either an unsubstituted benzene ring or:

- 
2. A compound according to claim 1, wherein R is independently selected from a lower alkyl group having 1 to 10 carbon atoms, or an aralkyl group, preferably of up to 12 carbon atoms, or an aryl group, preferably of up to 12 carbon atoms, optionally substituted by one or more halo, hydroxy, amino, or nitro groups.
  
  3. A compound according to claim 2, wherein R is independently selected from lower alkyl groups having 1 to 10 carbon atoms optionally substituted by one or more halo, hydroxy, amino, or nitro groups.
  
  4. A compound according to claim 3, wherein R is an unsubstituted straight or branched chain alkyl group, having 1 to 10 carbon atoms.
  
  5. A compound according to any one of the preceding claims, wherein R<sub>1</sub> has a carbamate functionality where it binds to the nitrogen atom of the CPI.
  
  6. A compound according to any one of the preceding claims, wherein Y is NH-Prot, O-Prot or S-Prot.
  
  7. A compound according to claim 6, wherein Y is NH-Prot.
  
  8. A compound according to any one of the preceding claims, wherein X is either halogen or OSO<sub>2</sub>R.
  
  9. A compound according to any one of the preceding claims, wherein the 4,5 fused ring is substituted by -CO<sub>2</sub>R in the 2 or 3 position if it is a benzene ring, or in the 2 position if it is a pyrrole ring.
  
  10. The use of compounds of formula I:

wherein X is an electrophilic leaving group;

Y is selected from NH-Prot, O-Prot, S-Prot, NO<sub>2</sub>, NHOH, N<sub>3</sub>, NHR, NRR, N=NR, N(O)RR, NHSO<sub>2</sub>R, N=NPhR, SR or SSR, where Prot represents a protecting group;

5 A and B collectively represent a fused benzene or pyrrole ring (in either orientation), which is optionally substituted by up to respectively 4 or 2 groups independently selected from R, OH, OR, halo, nitro, amino, Me<sub>3</sub>Sn, CO<sub>2</sub>H, CO<sub>2</sub>R;

R<sub>1</sub> is a nitrogen protecting group, where if Y includes a protecting  
10 group, these protecting groups are orthogonal;

R<sub>2</sub> and R<sub>7</sub> are independently selected from H, R, OH, OR, halo, nitro, amino, Me<sub>3</sub>Sn;

wherein R is selected from

(a) a lower alkyl group having 1 to 10 carbon atoms,

15 (b) an aralkyl group (i.e. an alkyl group with one or more aryl substituents), preferably of up to 12 carbon atoms;

the alkyl group of (a) or (b) optionally containing one or more carbon-carbon double or triple bonds, which may form part of a conjugated system; and

20 (c) an aryl group, preferably of up to 12 carbon atoms; and

wherein R is optionally substituted by one or more halo, hydroxy, amino, or nitro groups, and optionally contains one or more hetero atoms, which may form part of, or be, a functional group;

in methods of combinatorial chemistry synthesis, wherein the  
25 compound of formula I is joined to a solid support by a chain comprising at least one combinatorial unit.

11. A compound of formula III:

wherein X, Y, A, B, R<sub>2</sub> and R<sub>7</sub> are as defined in claim 10;

T is a combinatorial unit;

and n is a positive integer, where if n is greater than 1, each T may be different;

5 L is a linking group, or less preferably a single bond;  
and O is a solid support.

12. A compound of formula III':

where A, B, R<sub>2</sub>, R<sub>7</sub>, T, n, L and O are as defined in claim 11; and

10 Y' is NH, O or S.

13. A compound of formula II :

wherein X, Y, A, B, R<sub>2</sub>, R<sub>7</sub>, T and n are as defined in claim 11.

14. A compound of formula **II'**:

wherein A, B, T, n, R<sub>2</sub>, R<sub>7</sub>, and Y<sup>1</sup> are as defined in claim 12.

15. A compound of formula **V**:

5

where A, B, Y, R<sub>1</sub>, R<sub>2</sub>, and R<sub>7</sub>, are as defined in claim 10 and T, n, L and O are as defined claim 11.

16. A compound of formula **V'**:

10

where A, B, R<sub>1</sub>, R<sub>2</sub>, and R<sub>7</sub> are as defined in claim 10 and T, n, L, Y<sup>1</sup> and O are as defined in claim 12.

17. A compound of formula **IV**:

wherein A, B, X, Y, R<sub>1</sub>, R<sub>2</sub> and R<sub>7</sub> are as defined in claim 10 and T and n are as defined in claim 11.

18. A compound of formula IV':

5

wherein A, B, T, n, R<sub>1</sub>, R<sub>2</sub> and R<sub>7</sub> are as defined in claim 17 and Y' is NH, O or S.

19. A method of preparing a compound according to claim 11 by  
10 reaction of a compound of formula VI:

with a compound of formula I:

where A, B, R<sub>2</sub>, R<sub>3</sub>, T, n, L and O are as defined in claim 11, and W is H or an atom or group for providing a functional group capable of reaction with -NH<sub>2</sub>.

~~5 20. A method of preparing a compound according to claim 15, by~~  
reaction of a compound of formula VI:

with a compound of formula I according to claim 9, where T, n, L and O are as defined in claim 15, and W is H or an atom or group for providing a functional group capable of reaction with -COOH.

21. 1A compound of formula VII:

wherein:

O, T, and L are as defined in the claim 11;

15 n and m are positive integers, or one of them may be zero;

T' is a combinatorial unit, where each T' may be different if m is greater than 1;

T'' is a combinatorial unit which provides a site for the attachment of D;

20 D is selected from:

(a)

wherein A, B, Y, R<sub>1</sub>, R<sub>2</sub> and R<sub>7</sub> are as defined in claim 10 and Y' is NH, O or S;

(b)

wherein  $X'$  is selected from CO, NH, S, or O;

$G$  is O, S, NH, or a single bond;

5  $R'_2$  and  $R'_3$  are independently selected from: H, R, OH, OR, =O, =CH-R, =CH<sub>2</sub>, CH<sub>2</sub>-CO<sub>2</sub>R, CH<sub>2</sub>-CO<sub>2</sub>H, CH<sub>2</sub>-SO<sub>2</sub>R, O-SO<sub>2</sub>R, CO<sub>2</sub>R, COR and CN, and there is optionally a double bond between  $C_2$  and  $C_3$ ;

$R'_6$ ,  $R'_7$ , and  $R'_9$  are independently selected from H, R, OH, OR, halo, nitro, amino, Me<sub>3</sub>Sn;

10  $R'_{11}$  is either H or R;

$Q'$  is S, O or NH;

$R'_{10}$  is a nitrogen protecting group;

$Y''$  is a divalent group such that  $HY = R$ ;

$p$  is a positive integer, where if  $p$  is greater than 1, for each  
15 repeating unit, the meaning of  $T$ ,  $T'$ ,  $T''$  and  $D$  and the values of  $n$  and  $m$  are independently selected; and

$E$  is selected from the same possibilities as  $D$ ;

provided that at least one group  $D$  or  $E$  is selected from (a).

20 22. A compound of formula (VIII):

wherein L, T, T', T'', D, E, n, m and p are as defined in claim 21.

23. A compound of formula (IX):

wherein O, L, T, T', T'', n, m and p are as defined in claim 21;  
 5 T'' is a combinatorial unit;  
 q is a positive integer, where if q is greater than 1, each T'' may be different; and  
 E<sub>a</sub> is selected from the group (a) of E as defined in claim 21;  
 where if p is greater than 1, for each repeating unit the meaning of  
 10 T, T', T'', T''' and the values of n, m and q are independently selected.

24. A compound of formula (X):

wherein L, T, T', T'', T''', E<sub>a</sub>, n, m, p and q are as defined in claim  
 15 23.

25. A collection of compounds all of which are represented by either:

- (i) formula III as defined in claim 11;
- 20 (ii) formula III' as defined in claim 12;
- (iii) formula II as defined in claim 13;
- (iv) formula II' as defined in claim 14;
- (v) formula V as defined in claim 15;
- (vi) formula V' as defined in claim 16;
- 25 (vii) formula IV as defined in claim 17;

- (viii) formula IV' as defined in claim 18;
  - (ix) formula VII as defined in claim 21;
  - (x) formula VIII as defined in claim 22;
  - (xi) formula IX as defined in claim 25; or
- 

5 (xii) formula X as defined in claim 24.

26. A method of preparing a collection of compounds as defined in claim 25.

10 27. A method of screening compounds of:

- (i) formula II as defined in claim 13;
- (ii) formula II' as defined in claim 14;
- (iii) formula IV as defined in claim 17;
- (iv) formula IV' as defined in claim 18;

15 (v) formula VIII as defined in claim 22; or  
(vi) formula X as defined in claim 24;  
to discover biologically active compounds.

28. The use of a compound of:

- 20 (i) formula II as defined in claim 13;
- (ii) formula II' as defined in claim 14;
  - (iii) formula IV as defined in claim 17;
  - (iv) formula IV' as defined in claim 18;
  - (v) formula VIII as defined in claim 22; or

25 (vi) formula X as defined in claim 24;  
in the manufacture of a cytotoxic, antibiotic, antiparasitic or  
antiviral therapeutic composition.

29. The use of a compound of:

- 30 (i) formula III as defined in claim 11;

- (ii) formula **III'** as defined in claim 12;
  - (iii) formula **V** as defined in claim 15;
  - (iv) formula **V'** as defined in claim 16;
  - (v) formula **VII** as defined in claim 21; or
- 

5 (vi) formula **IX** as defined in claim 23;  
in a method of diagnosis.

30. The use of a compound of:

- (i) formula **II** as defined in claim 13;
- 10 (ii) formula **II'** as defined in claim 14;
- (iii) formula **IV** as defined in claim 17;
- (iv) formula **IV'** as defined in claim 18;
- (v) formula **VIII** as defined in claim 22; or
- (vi) formula **X** as defined in claim 24;

15 in a method of target validation or functional genomics.
